**Introduction**: In Thailand, the radiofrequency catheter ablation among arrhythmia with congenital heart disease was limited.

**Methods**: The retrospectively study with symptomatic arrhythmic congenital heart disease for catheter ablation procedure during 1 January 1996 until 31 December, 2017. Clinical data, ablation procedure were classified.

**Result**: The congenital heart disease among arrhythmia in Ramathibodi hospital 29 patients There were male 11 (37.9%) patients, mean age 36.3 years old, ASD 10 (34.5%) patients and Ebstein’s anomaly 9 (31.0%) patients, respectively. The efficacy of treatment 95.1%. The most common arrhythmia were AVRT 12 (41.4%) patients and atrial fibrillation 6 (20.7%) respectively. The complication was AV block 2 (6.9%) patients.

**Conclusion**: Catheter ablation was effective treatment and low complication for arrhythmia congenital heart disease.
