Figure 1
An ECG of the tilt table test, previous the procedure, showing a cardioinhibitory response of 60 seconds.

Figure 2
Extracardiac vagal stimulation of 5 seconds before the procedure, showing a complete cardioinhibition response during and after the stimulation (left panel). The same extracardiac vagal stimulation showing no vagal response, which confirms an adequate parasympathetic modulation after the procedure.
Figure 3

A negative Tilt table test 5 months after the procedure. Worth mentioning, the steady heart rate response throughout the exam.

bpm = Beats per minute; FC = Heart rate; mmHg = millimeter of mercury; PD = Diastolic blood pressure; PS = Systolic blood pressure.
