Figure 1. 12-lead ECG at onset of bradycardia showing isorhythmic atrioventricular dissociation and wide complex ventricular escape rhythm at 49 bpm with right bundle branch block pattern.

Figure 2. ECG strips (lead II) at hour 4 (top), hour 8 (middle) and hour 30 (bottom) of the event demonstrating gradual elevation of sinus rate, shortening of PR interval and shortening of QRS duration. Intermittent non-sustained short runs of ventricular tachycardia at rate of up to 150bpm was noted at early phase of the event (top). There ECG was resumed to baseline after 30 hours (bottom).
